

NOTE: Configurations, geometry, units, AND questions can and will be changed on the final exam.

ARCH 331. Practice Final Examination

Note: No aids are allowed for part 1. For part 2, a reference document and any necessary charts will be provided (also posted), and two single sides of letter sized paper with notes are allowed along with a silent, **non-programmable** calculator.

Part 1) Worth 10% (conceptual questions)

Part 2) Clearly show all your work and record your **final answers in the boxes.**

Question 1) Worth 45%

- Solid slabs 5 in.-thick are integrally supported on three beams in a two-story frame. The center to center beam spacing is 25 ft.
- The floor slab has a dead load of 30 lb/ft² (not including self weight), and a live load of 50 lb/ft².
- The roof slab has a dead load of 25 lb/ft² (not including self weight) and live load of 20 lb/ft².
- The cross section geometry of the beams supporting the slab is shown in Figure 1a. The 12 in. by 20 in. beam has 6 #8 bars (two layers), #3 stirrups, and $I = 5200 \text{ in}^4$. The self weight is 233 lb/ft.
- The material is light-weight concrete (140 lb/ft³) with $E = 3,460 \text{ ksi}$ and $f'_c = 4,000 \text{ psi}$ with grade 60 reinforcement.
- The beams are supported on girders. Figure 1b shows the *factored* total loading on a girder section in the frame from live, dead, and wind loading.

FIND:

- If the *first* floor slab is adequate for shear assuming $d=4 \text{ in.}$ and the clear span, $l_m = 24 \text{ ft.}$
- The completed bending moment diagram and maximum factored moment for the girder (Figure 1b & c).
- If the beam is adequate for bending and reinforcing when $M_u = 275 \text{ k-ft}$, knowing $d = 16.625 \text{ in.}$
- The recommended reinforcement ratio, ρ , for the beam when the design moment, $M_u = 180 \text{ k-ft}$.
- The most economical W section of A992 ($F_y = 50 \text{ ksi}$) steel that could be used for a 29 ft simply supported beam using the provided Beam Design Moment diagrams if the unbraced length is 12.5 ft and $M_u = 150 \text{ k-ft}$ at 10 ft to the right of B when no self weight has been included (yet).
- The maximum deflection of the beam shown in Figure 1b for a W 12 x 53 when end A is considered pinned and end D is considered fixed when there is an unfactored distributed load of 1600 lb/ft over the entire length. $E = 29 \times 10^3 \text{ ksi}$, $I_x = 425 \text{ in}^4$, and $I_y = 95.8 \text{ in}^4$.
- The minimum dimension required for a square footing 18 in. deep when the dead load is 105.7 kips and the live load is 36.5 kips for a soil with $q_{\text{allowed}} = 1800 \text{ lb/ft}^2$ and a density of 80 lb/ft³. Assume normal weight concrete (150 lb/ft³).
- The maximum two-way design shear in a 10 ft. square footing having the loads in part g) when the column is 18 in. square and $d = 13.5 \text{ in.}$

Disclaimer: Answers have NOT been painstakingly researched.

a) yes ($2567 \text{ lb/unit} < \phi V_c$)	b)	e)
c) no ($\rho > \rho_{0.05}$, $\phi M_n = 280.3 \text{ k-ft}$)	d) 0.013	
f) 0.86 in	g) 9.16 ft	h) 172.5 k

Question 2) Worth 45%

- A parallel chord truss is shown in the Figure 2a supports dead load and 7 day roof live load. It also has a lateral live load at B of 3 kips. The reactions at the pin and roller supports have been determined to be: $A_x = -3 \text{ k}$, $A_y = 7.33 \text{ k}$ and $E = 8.67 \text{ k}$.
- The truss is constructed with 5 1/8 in. x 12 in. glu-lam lumber for the top and bottom chords having $E = 1.85 \times 10^6 \text{ psi}$, $\alpha = 3.8 \times 10^{-6} / ^\circ\text{F}$, $F_c = 1700 \text{ psi}$ (no adjustment factors); $F'_p = 750 \text{ psi}$ (with adjustment factors).
- The top chord is connected to a vertical web member as shown in Figure 2b with 2 - 3/4" A 325-SC bolts (class A), standard bolt holes and 3 in. spacing.
- The truss is constructed with a L 4 x 3.5 x 1/2 in. steel angle welded flush to a 0.75 in. x 3 in. plate for the vertical web members as shown in Figures 2b and c.
- The truss is constructed with C 3 x 5 steel channel sections for the diagonal members as shown in Figures 2 b and c. There is a lap splice as shown.
- All steel is A36 ($F_y = 36 \text{ ksi}$, $F_u = 58 \text{ ksi}$). The weld material is EXX60.

Figure 2a

Figure 2b (side)

FIND:

- The member forces in BC and HC using the method of sections.
- The moment of inertia about the x axis for the vertical steel web members by completing the chart of Table 2 when $\hat{y} = 1.196''$ from the top of the section.
- The maximum (factored) compressive load for the vertical steel web members when $r_x = 1.01 \text{ in.}$ and $r_y = 1.80 \text{ in.}$
- If the top glu-lam chord from C to D is adequate with a member force of 75 kips in compression and a maximum unbraced length of 9 ft. laterally. The ends are pinned in the plane of the truss.
- The size of the weld required for the lap splice with a factored member force of 40.5 kips in tension.
- The maximum (factored) shear in the bolts of the connection shown considering the vertical member only.
- The *design capacity* of the bolted connection shown with respect to bearing in the diagonal member ($t_w = 0.258 \text{ in.}$) **and** the top chord.
- The *design capacity* of the bolted connection shown with respect to tension for the vertical steel member assuming a shear lag factor, $U = 0.80$.

Figure 2c (top)

Table 2

	A (in ²)	I _x (in ⁴)	d _y (in)	Ad _y ² (in ³)
