ARCHITECTURAL STRUCTURES:

FORM, BEHAVIOR, AND DESIGN

ARCH 331

DR. ANNE NICHOLS

FALL 2013

lecture SIXteen

wood construction: column design

Compression Members (revisited)

- designed for strength & stresses
- designed for serviceability & deflection
- need to design for <u>stability</u>
 - ability to support a specified load without sudden or unacceptable deformations

Effect of Length (revisited)

long & slender

Critical Stresses (revisited)

- when a column gets stubby, crushing will limit the load
- real world has loads with eccentricity

Bracing (revisited)

- bracing affects shape of buckle in one direction
- both should be checked!

Wood Columns

- slenderness ratio = L/d_{min}
 - $-d_1 = smallest dimension$
 - $-\ell_e/d \leq 50$ (max)

$$f_c = \frac{P}{A} \le F_c'$$

- where F' is the allowable compressive strength parallel to the grain
- bracing common
- posts, round, built-up

Allowable Wood Stress

$$F_c' = F_c(C_D)(C_M)(C_t)(C_F)(C_p)$$
where:

 $F_c = compressive strength$

parallel to grain

 C_D = load duration factor

 C_M = wet service factor (1.0 dry)

 C_t = temperature factor

 C_F = size factor

 $C_p = column stability factor$

(Table 10.3)

Strength Factors

- wood properties and load duration, C_D
 - short duration
 - higher loads
 - normal duration
 - > 10 years

http://www.swst.org/teach/set2/struct1.html

- stability, C_p
 - combination curve tables

$$F_c' = F_c^* C_p = (F_c C_D) C_p$$

C_p Charts – Appendix A

Table 14 Column Stability Factor C_p.

"C_p"
$$F_{c'} = C_p \cdot F_{cE} = \frac{.30 E}{(l/d)^2} \text{ for sawed posts } F_{CE} = \frac{.418 E}{(l/d)^2} \text{ for glu-lam posts}$$

| | | | | | | | | - | | | | | | | |

Procedure for Analysis

- 1. calculate L_e/d_{min}
 - KL/d each axis, choose largest
- 2. obtain F'_{c} compute $F_{cE} = \frac{K_{cE}E}{\binom{L_e}{d}^2}$ K_{cE} =0.3 sawn
 - $K_{cE} = 0.418 \text{ glu-lam}$
- 3. compute $F_c^* \approx F_c C_D$
- 4. calculate F_{cE}/F_c^* and get C_p (Table 14)
- 5. calculate $F_c' = F_c^* C_p$

Procedure for Analysis (cont'd)

- 6. compute $P_{allowable} = F'_c \cdot A$
 - or find $f_{actual} = P/A$
- 7. is $P \le P_{allowable}$? (or $f_{actual} \le F'_{c}$?)
 - yes: OK
 - no: overstressed & no good

Procedure for Design

- 1. guess a size (pick a section)
- 2. calculate L_e/d_{min}
 - KL/d each axis, choose largest
- 3. obtain F'_{c} compute $F_{cE} = \frac{K_{cE}E}{\binom{L_{e}}{d}^{2}}$ K_{cE} =0.3 sawn
 - $K_{cE} = 0.418 \text{ glu-lam}$
- 4. compute $F_c^* \approx F_c C_D$
- 5. calculate F_{cE}/F_c^* and get C_p (Table 14)

Procedure for Design (cont'd)

6. compute
$$F'_c = F_c^* C_p$$

- 7. compute $P_{allowable} = F'_c \cdot A$
 - or find $f_{actual} = P/A$
- 8. is $P \le P_{allowable}$? (or $f_{actual} \le F'_{c}$?)
 - yes: OK
 - no: pick a bigger section and go back to step 2.

Timber Construction by Code

- light-frame
 - light loads
 - -2x's
 - floor joists 2x6, 2x8,
 2x10, 2x12 typical at
 spacings of 12", 16", 24"

- normal spans of 20-25 ft or 6-7.5 m
- plywood spans between joists
- <u>stud</u> or load-bearing masonry walls
- limited to around 3 stories fire safety

Design of Columns with Bending

- satisfy
 - strength
 - stability
- pick
 - section

(a) Framed beam (shear) connection. e = Eccentricity; $M = P \times e$

(c) Timber beam-column connection. $e = d/2 = eccentricity; M = P \times e$

(b) Moment connection (rigid frame). M = Moment due to beam bending

(d) Upper chord of a truss—compression plus bending. $M = \frac{\omega \ell^2}{2}$

Design

Wood

$$\left[\frac{f_c}{F_c'}\right]^2 + \frac{f_{bx}}{F_{bx}'\left[1 - \frac{f_c}{F_{cEx}}\right]} \le 1.0$$

[] $term - magnification factor for P-\Delta$ $F'_{bx} - allowable bending strength$

Design Steps Knowing Loads

- 1. assume limiting stress
 - buckling, axial stress, combined stress
- 2. solve for r, A or S
- 3. pick trial section
- 4. analyze stresses
- 5. section ok?
- 6. stop when section is ok

Laminated Timber Arches

- two & three hinged arches
- bent to wide range of curves
- bending and compression
- residual stress from laminating, C_c

Laminated Arch Design

- radius of curvature, R, limited by lam thickness, t
 - -R = 100t southern pine & hardwoods
 - -R = 125t softwood
- r = radius to inside face of laminations

•
$$C_C = 1 - 2000 \left(\frac{t}{r}\right)^2$$

• $F_b' = F_b(C_FC_c)$

Fig. 24.6 Circular arch moment analysis
