Reinforcement

- prestressing strand
- post-tensioning
- stirrups
- detailing
 - development length
 - anchorage
 - splices

Concrete Beams 10
Lecture 22

Foundations Structures
ARCH 331

<http://nisee.berkeley.edu/godden>
F2008abn

Behavior of Composite Members

- plane sections remain plane
- stress distribution changes

$$f_1 = E_1 \varepsilon = -\frac{E_1 y}{\rho}$$

$$f_2 = E_2 \varepsilon = -\frac{E_2 y}{\rho}$$

Concrete Beams 12
Lecture 22

Foundations Structures
ARCH 331

F2008abn

Transformation of Material

- n is the ratio of E 's
$$n = \frac{E_2}{E_1}$$
- effectively widens a material to get same stress distribution

Concrete Beams 13
Lecture 22

Foundations Structures
ARCH 331

F2008abn

Stresses in Composite Section

- with a section transformed to one material, new I
 - stresses in that material are determined as usual
 - stresses in the other material need to be adjusted by n

$$n = \frac{E_2}{E_1} = \frac{E_{steel}}{E_{concrete}}$$

$$f_c = -\frac{My}{I_{transformed}}$$

$$f_s = -\frac{Myn}{I_{transformed}}$$

Concrete Beams 14
Lecture 22

Foundations Structures
ARCH 331

F2008abn

Reinforced Concrete - stress/strain

Stresses in the concrete above the neutral axis are compressive and nonlinearly distributed. In the tension zone below the neutral axis, the concrete is assumed to be cracked and the tensile force present to be taken up by reinforcing steel.

Typical stress-strain curve for concrete.

Working stress analysis. (Concrete stress distribution is assumed to be linear. Service loads are used in calculations.)

Actual stress distribution near ultimate strength (nonlinear).

Ultimate strength analysis. (A rectangular stress block is used to idealize the actual stress distribution. Calculations are based on ultimate loads and failure stresses.)

Reinforced Concrete Analysis

- for stress calculations
 - steel is transformed to concrete
 - concrete is in compression above n.a. and represented by an equivalent stress block
 - concrete takes no tension
 - steel takes tension
 - force ductile failure

F2008abn

Location of n.a.

- ignore concrete below n.a.
- transform steel
- same area moments, solve for x

$$bx \cdot \frac{x}{2} - nA_s (d - x) = 0$$

Concrete Beams 17
Lecture 22

Foundations Structures
ARCH 331

F2008abn

T sections

- n.a. equation is different if n.a. below flange

$$b_f h_f \left(x - \frac{h_f}{2} \right) + (x - h_f) b_w \frac{(x - h_f)}{2} - nA_s (d - x) = 0$$

Wang & Salmon, Chapter 3

Concrete Beams 20
Lecture 22

Foundations Structures
ARCH 331

F2008abn

Force Equations

- $C = 0.85 f'_c b a$
- $T = A_s f_y$
- where
 - $f'_c =$ concrete compressive strength
 - $a =$ height of stress block
 - $\beta_1 =$ factor based on f'_c
 - $x =$ location to the n.a.
 - $b =$ width of stress block
 - $f_y =$ steel yield strength
 - $A_s =$ area of steel reinforcement

Equilibrium

- $T = C$
- $M_n = T(d-a/2)$
 - $d =$ depth to the steel n.a.
- with A_s

$$A_s f_y = 0.85 f'_c b a$$
 - $a = \frac{A_s f_y}{0.85 f'_c b}$
 - $M_u \leq \phi M_n$ $\phi = 0.9$ for flexure*
 - $\phi M_n = \phi T(d-a/2) = \phi A_s f_y (d-a/2)$

Over and Under-reinforcement

- over-reinforced
 - steel won't yield
- under-reinforced
 - steel will yield
- reinforcement ratio
 - $\rho = \frac{A_s}{bd}$
 - use as a design estimate to find A_s, b, d
 - max ρ is found with $\epsilon_{steel} \geq 0.004$ (not ρ_{bal})
 - *with $\epsilon_{steel} \geq 0.005, \phi = 0.9$

http://people.bath.ac.uk/abstj/concrete_video/virtual_lab.htm

A_s for a Given Section

- several methods
 - guess a and iterate
 1. guess a (less than n.a.)
 2. $A_s = \frac{0.85 f'_c b a}{f_y}$
 3. solve for a from $M_u = \phi A_s f_y (d-a/2)$

$$a = 2 \left(d - \frac{M_u}{\phi A_s f_y} \right)$$
 4. repeat from 2. until a from 3. matches a in 2.

A_s for a Given Section (cont)

- *chart method*
 - Wang & Salmon Fig. 3.8.1 R_n vs. ρ
- 1. calculate $R_n = \frac{M_n}{bd^2}$
- 2. find curve for f'_c and f_y to get ρ
- 3. calculate A_s and a
- *simplify by setting $h = 1.1d$*
