S2010abn

ARCH 614. Study Guide for Quiz 10

This guide is not providing "answers" for the conceptual questions. It is a list of topical concepts and their application you should be familiar with. It is an *aid* to help prepare for the quiz.

Covers material of Lectures 21, 22 & 23

- □ Constituents to make concrete
- □ Behavior in compression vs. tension of concrete
- □ Design methodology
- □ Load and Resistance Factor Design
- □ Working loads
- $\hfill\square$ Factored loads
- □ Resistance Factors
- □ "Design" values vs. "Capacity"
- □ Density of materials and relation to weight
- \Box Load types (and directions) (*like D, L, S*...)
- □ Load combinations
- □ Minimum Design Loads & Requirements
- □ Serviceability and limits
- □ Creep
- □ "composite"
- □ Transformed section
- □ Depth of the Whitney stress
- □ Moment capacity (or ultimate strength) vs. nominal moment (or strength)
- □ Factored design moment (or shear or)
- □ Design stress in reinforcement
- □ Design stress in concrete
- \Box Effective depth vs. depth of a beam
- □ Reinforcement grades

- □ Reinforcement ratio
- □ Under-reinforced vs. over-reinforced
- Purpose of minimum reinforcement area requirement
- \Box Use of Strength Design Curves (R_n)
- □ Purpose of stirrup requirement when concrete capacity is available
- □ Shrinkage
- \Box Cracks
- \Box Concrete cover and purpose
- \Box Clear span
- \square #3 bar (meaning of the numeral)
- □ Why bars need space between/around them
- □ Purpose of compression reinforcement
- □ T-section behavior and stresses in flange
- □ One-way slabs design and "unit" strip
- \Box One-way shear (load & strength)
- □ Stirrup strength
- □ Why torsional shear stirrups are "closed"
- \Box Why development length is necessary
- □ Location of maximum shear in beams
- □ Torsional (shear) stress (and where maximum occurs)
- □ Design vs. analysis
