Masonry Design

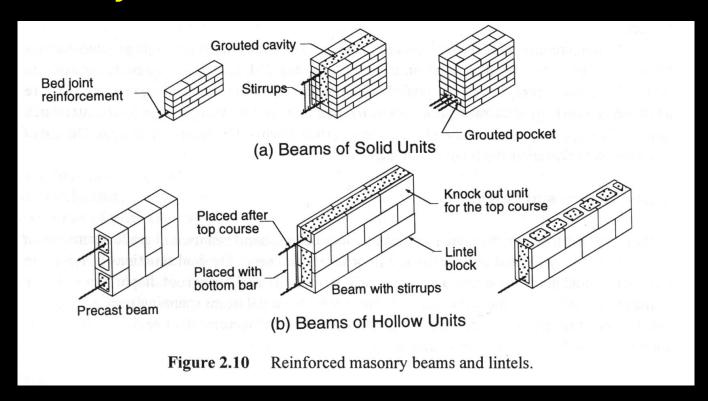

Masonry Standards Joint Committee

- ACI, ASCE, TMS
- ASD (+empirical)
 - linear-elastic stresses
- LRFD added in 2002
- referenced by IBC
- unreinforced allows tension in flexure
- reinforced all tension in steel
- walls are also in compression

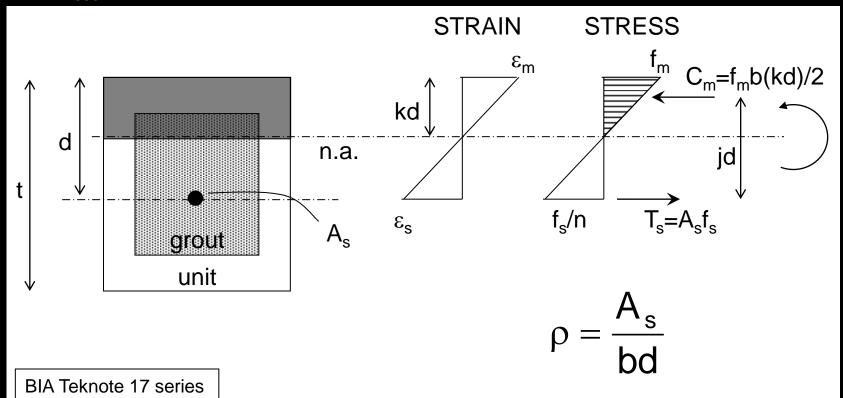

Masonry Beam & Wall Design

reinforcement increases capacity & ductility

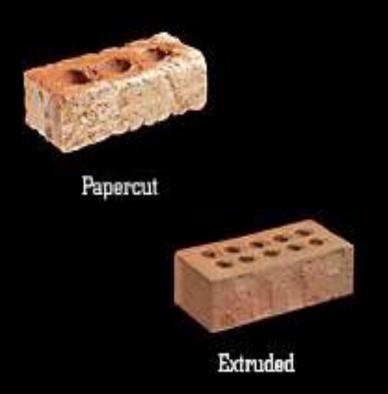

Masonry Design

- f_s is not the yield stress
- f_m is the stress in the masonry

- units
 - stone, brick, concrete block, clay tile

- mortar
 - water,masonry cement,sand, lime
 - types:
 - M higher strength 2500 psi (ave.)
 - S medium high strength 1800 psi
 - N medium strength 750 psi
 - O medium low strength 350 psi
 - K low strength 75 psi

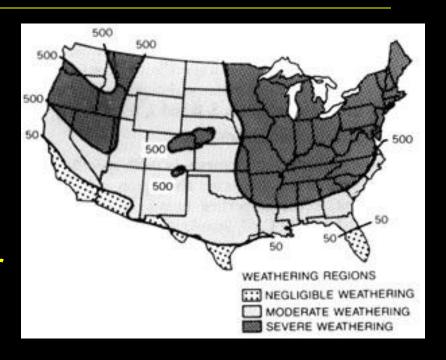

- rebar
- grout
 - fills voids and fixes rebar
- prisms
 - used to test strength,f'_m
- fire resistant

- moisture resistance
 - weathering index for brick
 - bond and detailing
 - expansion or shrinking from water
 - provide control joints
 - parapets, corners, long walls

parapet with no control joint

Allowable Masonry Stresses

tension - <u>unreinforced</u> only

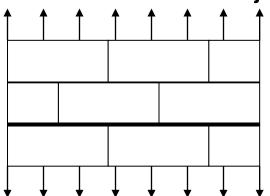

Table 2.2.3.2 — Allowable flexural tensile stresses for clay and concrete masonry, psi (kPa)

Direction of flexural tensile stress and masonry type	Mortar types			
	Portland cement/lime or mortar cement		Masonry cement or air entrained portland cement/lime	
	M or S	N	M or S	N
Normal to bed joints				
Solid units	53 (366)	40 (276)	32 (221)	20 (138)
Hollow units ¹				
Ungrouted	33 (228)	25 (172)	20 (138)	12 (83)
Fully grouted	86 (593)	84 (579)	81 (559)	77 (531)
Parallel to bed joints in running bond				
Solid units	106 (731)	80 (552)	64 (441)	40 (276)
Hollow units				
Ungrouted and partially grouted	66 (455)	50 (345)	40 (276)	25 (172)
Fully grouted	106 (731)	80 (552)	64 (441)	40 (276)
Parallel to bed joints in masonry not laid in running bond				
Continuous grout section parallel to bed joints	133 (917)	133 (917)	133 (917)	133 (917)
Other	0 (0)	0 (0)	0 (0)	0 (0)

For partially grouted masonry, allowable stresses shall be determined on the basis of linear interpolation between fully grouted hollow units and ungrouted hollow units based on amount (percentage) of grouting.

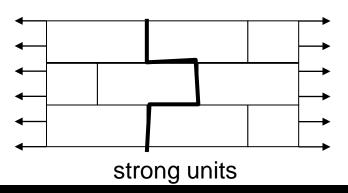

Masonry Walls

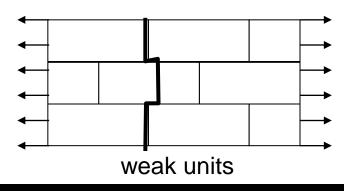

tension normal to bed joints

Not allowed in MSJC codes

tension parallel to bed joints

Allowable Masonry Stresses

flexure

- $-F_b = 1/3 f'_m$ (unreinforced)
- $-F_b = 0.45 f'_m$ (reinforced)
- shear, unreinforced masonry

$$-F_{v} = 1.5\sqrt{f'_{m}} \le 120 \text{ psi}$$

shear, reinforced masonry

$$- M/Vd \le 0.25$$
: $F_v = 3.0\sqrt{f_m'}$

$$-M/Vd \le 0.25$$
: $F_v = 2.0\sqrt{f'_m}$

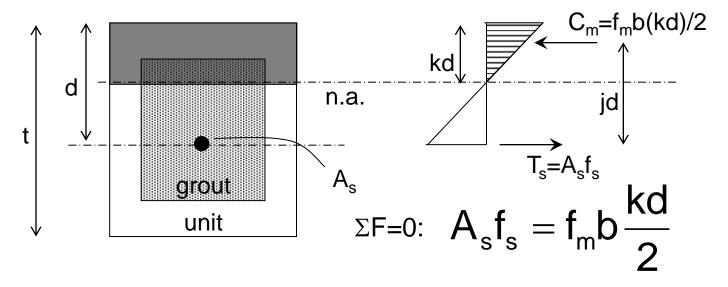

Allowable Reinforcement Stress

tension

- a) Grade 40 or 50 $F_s = 20 \text{ ksi}$
- b) Grade 60 $F_s = 32 \text{ ksi}$
- c) Wire joint $F_s = 30 \text{ ksi}$

- *no allowed increase by 1/3 for combinations with wind & earthquake
 - did before 2011 MSJC code

Reinforcement, Ms

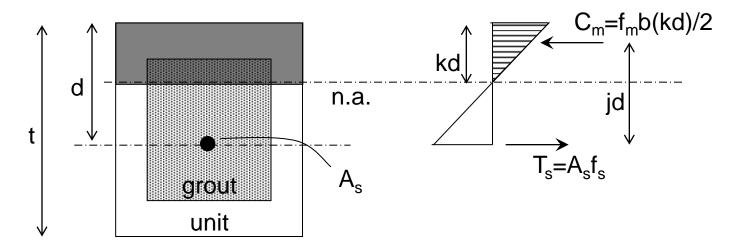

$$\Sigma M$$
 about C_m : $M_s = A_s f_s jd = \rho bd^2 jf_s$

if f_s=F_s (allowable) the moment capacity is limited by the steel

MSJC: $F_s = 20$ ksi, 32 ksi or 30 ksi by type

Reinforcement, M_m

for equilibrium:

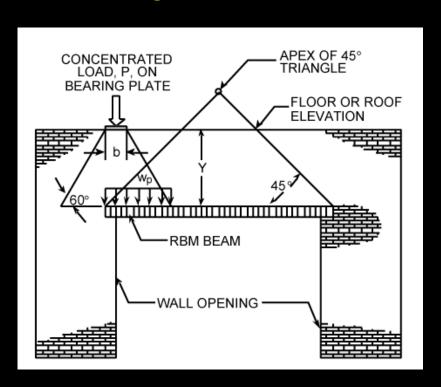

$$\sum \dot{M} = 0 \text{ about } F_s \qquad M_m = f_m b \frac{kd}{2} jd = 0.5 f_m b d^2 jk$$

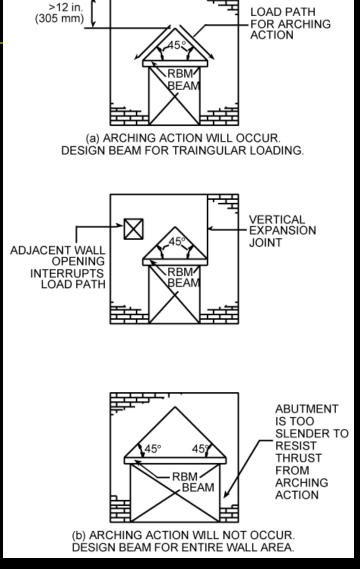

if f_m=F_b (allowable) the moment capacity is limited by the masonry

$$MSJC F_b = 0.33 f'_m$$

Masonry Lintels

- distributed load
 - triangular or trapezoidal

Strategy for RM Flexural Design

- to size section and find reinforcement
 - find ρ_b knowing f'_m and f_y
 - size section for some ρ < ρ_b
 - get k, j • $bd^2 = \frac{M}{\rho i F}$

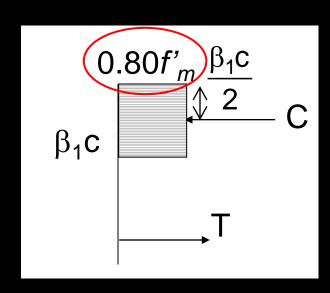

needs to be sized for shear also

- get b & d in nice units
- size reinforcement (bar size & #): $A_s = \frac{M}{F_s jd}$
- check design: $M_s = A_s F_s jd > M$

$$f_b = \frac{M}{0.5bd^2 jk} < F_b$$

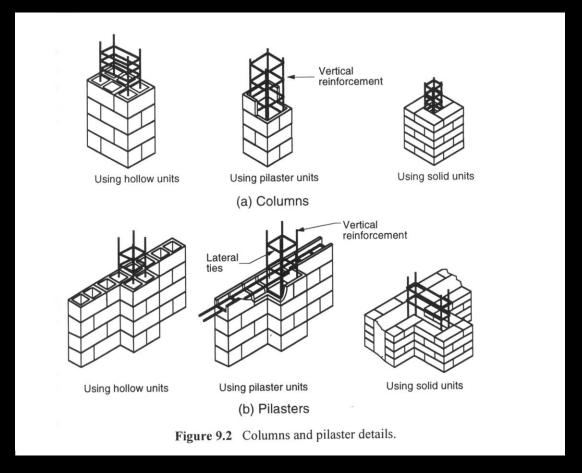

Ultimate Strength Design

- LRFD
- like reinforced concrete
- useful when beam shear is high
- improved inelastic model
 - ex. earthquake loads

Masonry Columns and Pilasters

must be reinforced

Masonry Columns and Pilasters

- considered a column when b/t<3 and h/t>4
 - b is width of "wall"
 - t is thickness of "wall"
- slender is
 - -8" one side
 - $-h/t \leq 25$
- needs ties
- eccentricity may be required

Masonry Columns

allowable axial load

$$P_{a} = \begin{bmatrix} 0.25 f'_{m} A_{n} + 0.65 A_{st} F_{s} \end{bmatrix} 1 - \left(\frac{h}{140r} \right)^{-1}$$

$$h/r \le 99$$

$$P_{a} = \left[0.25 f'_{m} A_{n} + 0.65 A_{st} F_{s}\right] \left(\frac{70r}{h}\right)^{2}$$

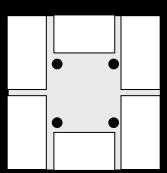

$$h/r > 99$$

h = effective length

 A_n = effective area of masonry

 $A_{st} = effective area of column reinforcement$

 F_s = allowable compressive stress in column reinforcement (lesser of 0.4 f_v or 24 ksi)

Masonry Walls (unreinforced)

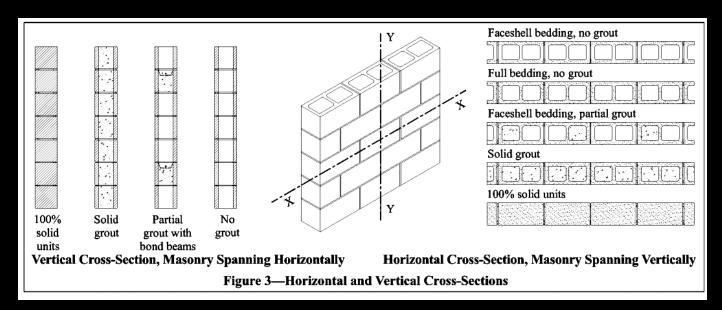

- allowable axial stresses

$$F_{a} = 0.25 f'_{m} \left[1 - \left(\frac{h}{140r} \right)^{2} \right]$$

$$h/r \le 99$$

$$F_a = 0.25 f'_m \left(\frac{70r}{h}\right)^2$$

$$h/r > 99$$

Design

masonry columns and walls (unreinforced)

$$\frac{f_a}{F_a} + \frac{f_b}{F_b} \le 1.0 \quad \text{and} \quad f_b - f_a \le F_t$$

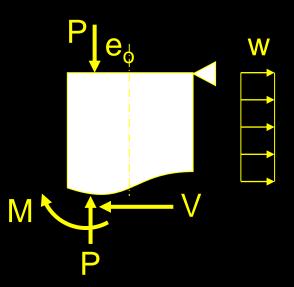

$$-h/r < 99 \quad F_a = 0.25 f'_m \left[1 - \left(\frac{h}{140r} \right)^2 \right]$$

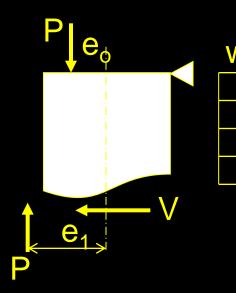

$$-h/r > 99 \quad F_a = 0.25 f'_m \left(\frac{70r}{h} \right)^2$$

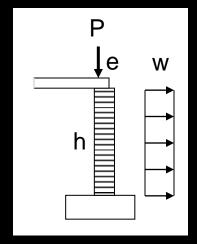

$$F_b = 0.33 f'_m$$

Design

- masonry columns and walls loading
 - wind loading
 - eccentric axial load
 - "virtual" eccentricity, e₁

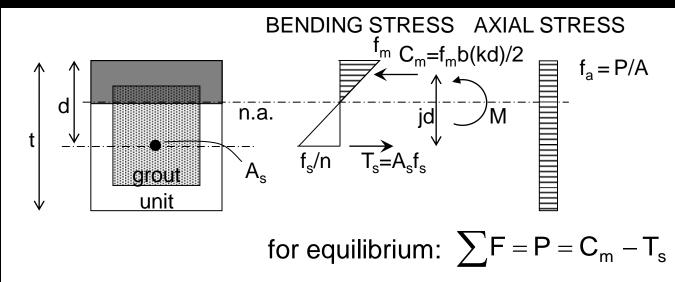

$$e_1 = \frac{M}{P}$$

virtual eccentricity

Design

- masonry columns and walls with rebar
 - wall reinforcement usually at center and ineffective in compression

$$f_a + f_b \le F_b$$
 provided $f_a \le F_a$

Design Steps Knowing Loads

- 1. assume limiting stress
 - buckling, axial stress, combined stress
- 2. solve for r, A or S
- 3. pick trial section
- 4. analyze stresses
- 5. section ok?
- 6. stop when section is ok
