ELEMENTS OF ARCHITECTURAL STRUCTURES: FORM, BEHAVIOR, AND DESIGN ARCH 614 DR. ANNE NICHOLS Spring 2014

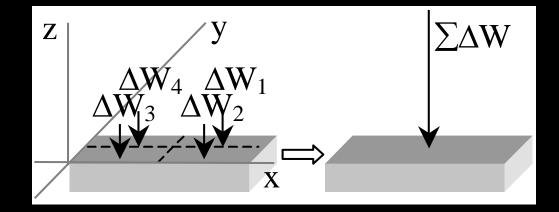

lectyre eignt

# 

# Center of Gravity

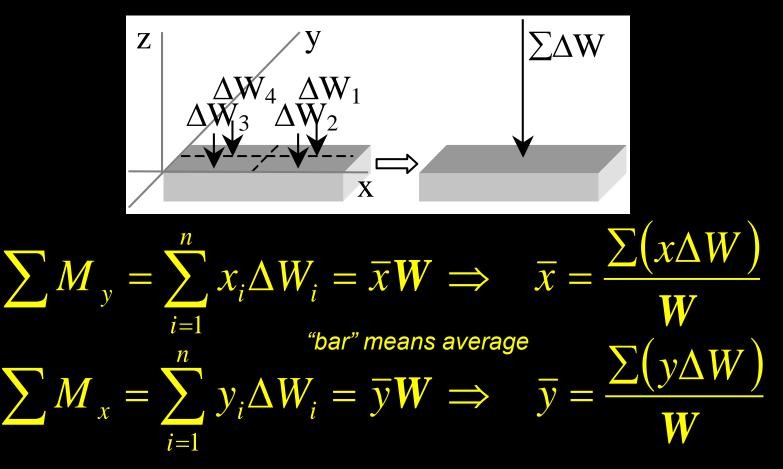

- location of equivalent weight
- determined with calculus

• sum element weights  $W = \int dW$ 

## Center of Gravity

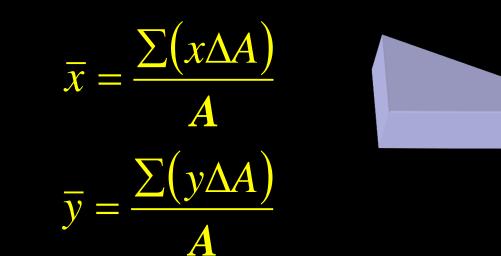

"average" x & y from moment

Sections 3 Lecture 8 Elements of Architectural Structures ARCH 614

## Centroid

- "average" x & y of an area
- for a volume of constant thickness
  - $-\Delta W = \gamma t \Delta A$  where  $\gamma$  is weight/volume
  - center of gravity = centroid of area

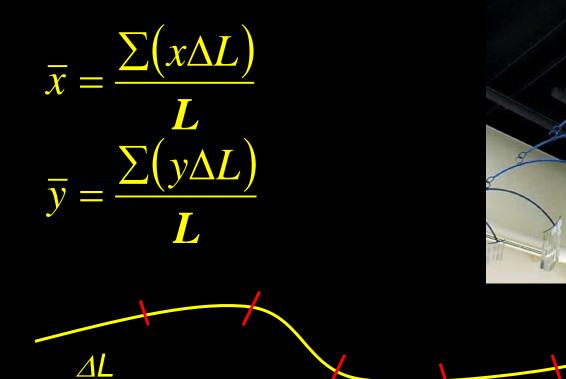

Elements of Architectural Structures ARCH 614

## **Centroid**

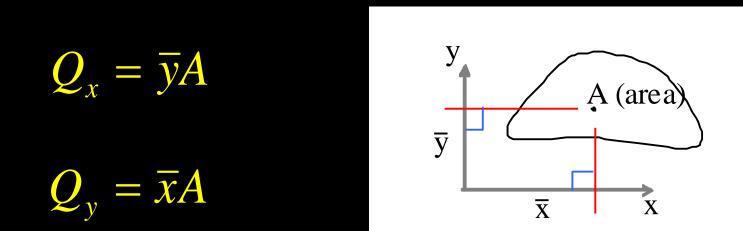

• for a line, sum up length

## 1<sup>st</sup> Moment Area

- math concept
- the moment of an <u>area</u> about an axis

# Symmetric Areas

 symmetric about an axis

 symmetric about a center point

• mirrored symmetry

## **Composite Areas**

- made up of basic shapes
- areas can be <u>negative</u>
- (centroids can be negative for any area)

## **Basic Procedure**

- 1. Draw reference origin (if not given)
- 2. Divide into basic shapes (+/-)
- 3. Label shapes

1	Draw table	Component	Area	$\overline{X}$	$\overline{x}A$	$\overline{y}$	ÿΑ
4.	Diaw labie						
5.	Fill in table	Σ					

- 6. Sum necessary columns
- 7. Calculate  $\hat{x}$  and  $\hat{y}$

# Area Centroids

#### • *Figure A.1 – pg 598*

 $\frac{3h}{5}$ 

# Moments of Inertia

• 2<sup>nd</sup> moment area -math concept – area x (distance)<sup>2</sup> need for behavior of - beams - columns

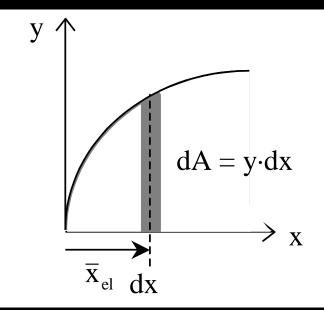

# Moment of Inertia

- about any reference <u>axis</u>
- can be <u>negative</u>

$$I_{y} = \sum x_{i}^{2} \Delta A = \int x^{2} dA$$
$$I_{x} = \sum y_{i}^{2} \Delta A = \int y^{2} dA$$
$$(or \ I_{x-x} = \sum z^{2} a)$$

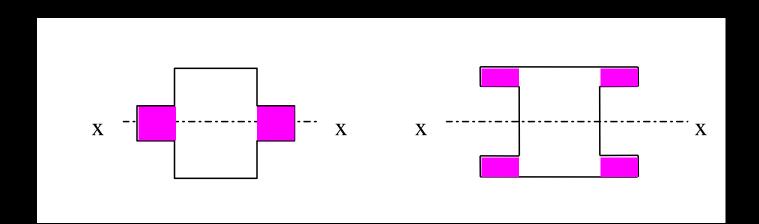

resistance to bending and buckling

Elements of Architectural Structures ARCH 614

## Moment of Inertia

 same area moved away a distance – larger I

## Polar Moment of Inertia

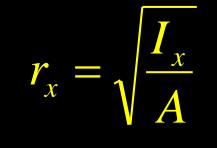

- for roundish shapes
- uses polar coordinates (r and  $\theta$ )
- resistance to twisting

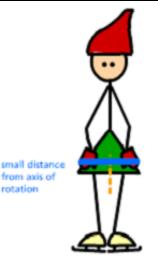

$$J_o = \int r^2 dA$$

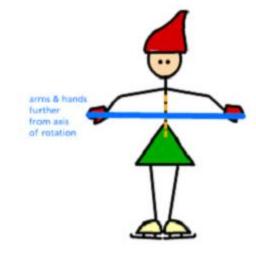

## Radius of Gyration

measure of inertia with respect to area  $\bigcirc$ 

When a figure skater changes position, he or she is redistributing his or her mass. Thus, every position has it's own unique rotational inertia.

The rotational inertia of the figure skater increases when her arms are raised because more of her mass is redistributed further from her axis of rotation.

Sections 15 Lecture 8

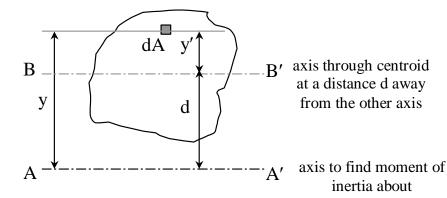

from axis of rotation

## Parallel Axis Theorem

 can find composite I once composite centroid is known (basic shapes)

$$I = I_o + Az^2$$
$$= \bar{I}_x + Ad_y^2$$

$$I = \sum I + \sum Ad^2$$

 $= I - Ad^2$ 

Elements of Architectural Structures ARCH 614

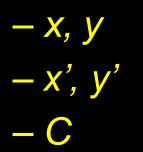

## **Basic Procedure**

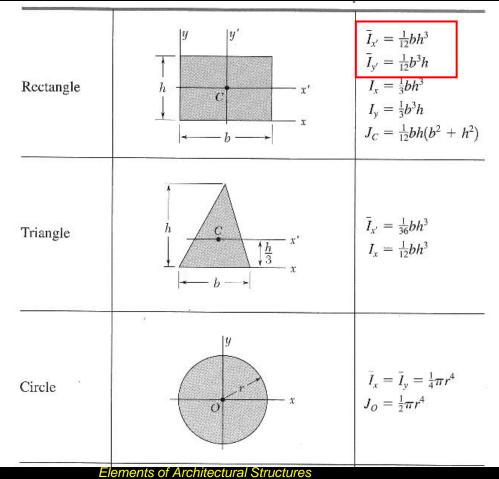

- 1. Draw reference origin (if not given)
- 2. Divide into basic shapes (+/-)
- 3. Label shapes
- 4. Draw table with A,  $\overline{x}$ ,  $\overline{x}A$ ,  $\overline{y}$ ,  $\overline{y}A$ ,  $\overline{I}$ 's, d's, and Ad<sup>2</sup>'s
- 5. Fill in table and get  $\hat{x}$  and  $\hat{y}$  for composite
- 6. Sum necessary columns
- 7. Sum  $\overline{I}$ 's and Ad<sup>2</sup>'s

$$(\begin{array}{c}d_{x} = \hat{x} - \overline{x} \\ d_{y} = \hat{y} - \overline{y}\end{array})$$

## Area Moments of Inertia

• Figure A.11 – pg. 611: (bars refer to centroid)
