design for  
lateral loads

Lateral Load Design 1  
Lecture 15

Applied Architectural Structures  
ARCH 631

F2012abn

Lateral Load Resistance

- stability important for any height
- basic mechanisms
  - shear walls
  - diaphragms
  - diagonal bracing
  - frame action
- resist any direction laterally without excessive movement

Figure 1.14 Earthquake loads on a structure.

Lateral Load Design 2  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

Lateral Load Resistance

- deformations
- load transfer & in-plane forces

Lateral Load Design 3  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

Load Direction

- layout

Lateral Load Design 4  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

# Rectangular Buildings

- short side (in red)
  - needs to resist most wind
  - bigger surface area
  - shear walls common
- long side
  - other mechanisms
- long & low
  - may only need end bracing
- symmetry important
  - avoid distortions, ex. twisting

Lateral Load Design 5  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

# Shear Walls

- resist lateral load in plane with wall

Lateral Load Design 6  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

# Shear Walls

- lateral resistance

**THE TWO-MINUTE ENGINEER**

**FORCES**

**Lateral load:** Forces applied parallel to level ground surface. (wind, seismic, backfill, etc.)

**Uplift:** Forces applied perpendicular to level ground surface, in an upward direction. (wind uplift and vertical seismic forces)

**REACTION**

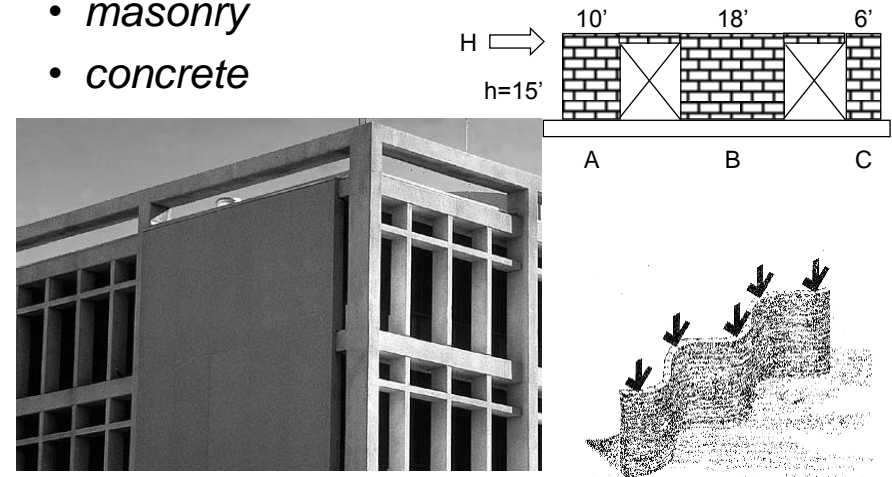

**Base shear:** The reaction at the base of a wall or structure due to an applied lateral load - "Sliding Force."

**Overturning:** What happens when a lateral force acts on a wall or structure and it can't slide - "Tip Over Force."

Lateral Load Design 7  
Lecture 14

# Shear Walls

- masonry
- concrete

<http://nisee.berkeley.edu/godden>

Lateral Load Design 8  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

## Shear Walls

- timber
  - wall studs with sheathing
  - vertical trusses

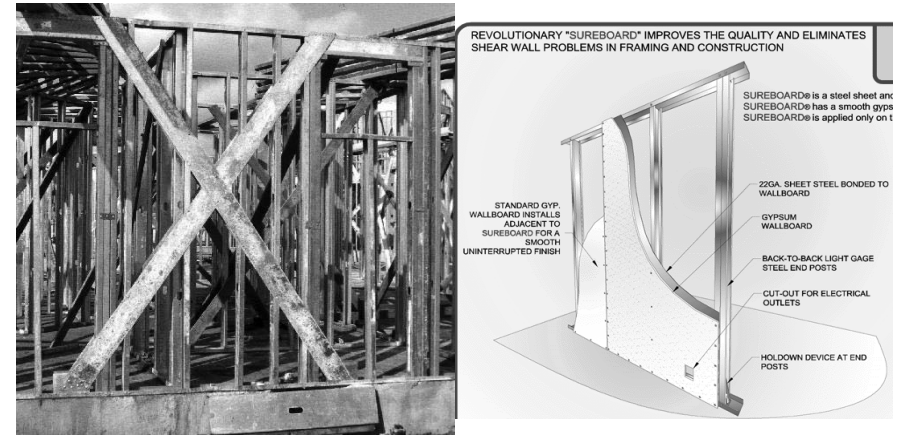

Lateral Load Design 9  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Shear Walls

- steel

Lateral Load Design 10  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Shear Walls

- insulated concrete forms (ICF)

Lateral Load Design 11  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Diaphragms

- roof and floor framing and decks
- relative stiffness
- necessary in pin connected beam-column frames with no horizontal resisting elements

Lateral Load Design 12  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

# Diaphragms

- connections critical
- drag struts

Lateral Load Design 13  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

# Braced Frames

- pin connections
- bracing to prevent lateral movements

Lateral Load Design 14  
Lecture 15

Architectural Structures III  
ARCH 631

<http://nisee.berkeley.edu/godden>

F2009abn

# Braced Frames

- types of bracing
  - knee-bracing
  - diagonal
  - X (cross)
  - K, V or chevron
  - shear walls

Lateral Load Design 15  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

# Rigid Framing and Bracing

Lateral Load Design 14  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Rigid Framing and Bracing

<http://isee.berkeley.edu/gooden>

Lateral Load Design 15  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

## Shear Walls & Diagonal Bracing

- use with pin connected members
  - steel common
  - concrete rare
- solid shear walls
  - concrete
  - masonry
- wide spaced shear walls or diagonal bracing requires floor diaphragms
  - timber, steel or composite

(a) Diagonal bracing (joints can be pin-connected)

(c) Shear wall (joints can be pin-connected)

Lateral Load Design 17  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Frame Action

- choice influenced by ease of rigid joint construction by system
  - concrete
  - steel
  - timber braces
- bending moments mean larger members

Lateral Load Design 16  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Member Orientation

- strong axis
  - biggest  $I$  in a non-doubly-symmetric section
  - resists bending better
- frame action & narrow dimension buildings
  - deep direction parallel to long is typical
  - very narrow parallel to short

Lateral Load Design 18  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Member Characteristics

- long span members preclude frame action

- shear walls can be combined with bearing walls
  - use determines orientation

Lateral Load Design 19  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Multistory Buildings

- strength design
  - frame action efficient up to ~ 10 stories
  - steel systems
  - reinforced concrete
    - flat plate & columns
      - lower lateral capacity
      - edge moments can't be resisted
      - end walls offer shear resistance
    - flat slab
    - one-way
    - two-way
      - higher resistance
  - elevator cores

www.allaboutskyscrapers.com

Lateral Load Design 21  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

## Building Height and Resistance

- low-medium rise
  - easier to accommodate
  - ex. residential
    - shear walls
    - diagonal bracing
    - floor diaphragms (panels)
- high rise
  - shear walls & bracing hinder functions
  - frames useful or with shear walls

http://gardenopolis.files.wordpress.com

Lateral Load Design 20  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

## Multistory Buildings

- overturning, rigidity

(c) Frame and core are connected with outrigger trusses for additional stiffness.

(f) Diagrid. Gravity and lateral forces are transferred through a triangulated column grid.

Lateral Load Design 22  
Lecture 14

Applied Architectural Structures  
ARCH 631

## Strength Design

- moments like cantilever beam
- tube action – bigger I
- elements
  - rigid at exterior resist lateral loads
  - interior can only carry gravity loads
- “stiffen” narrow shaped plans with shape

<http://darkwing.uoregon.edu/~struct/resources/applets/pencil.html>

Lateral Load Design 23  
Lecture 15

Architectural Structures III  
ARCH 631

F2009abn

## Deflection and Motion Control

- serviceability issues
  - vibration
  - deflection
  - displacement
- mechanisms
  - stiffness
  - tuned mass dampers
- rule of thumb:
  - limit static wind load deflections to  $h/500$

Lateral Load Design 24  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Wind Design

- codes
  - based upon minimum wind speed with 90% probability of 50 yr non-exceedance
- loads
  - pressure
  - drag
  - rocking
  - harmonic
  - uplift
  - torsion

Figure 1.13 Wind loads on a structure.

Lateral Load Design 25  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Wind Design Loads

- exposure
  - non-linear
  - equivalent static pressure based on wind speed

$$F_W = C_d q_h A$$

$$= pA$$

Lateral Load Design 25  
Lecture 14

Architectural Structures III  
ARCH 631

F2007abn

## Flood Design

- *know your risk*
  - zone A
    - 100 year flood, no data available
  - zone AE
    - 100 year flood, detailed analysis
  - zone E
    - outside 100 year flood, minimal depths

<http://youtu.be/TkfhuvOGbml> - Lake Delton, WI 2008

## Flood Design

- *loads*
  - hydrostatic pressure
    - up, down, lateral
  - impact velocities
    - scour
  - impact from debris
- *design*
  - elevation, proper site
  - shear walls with caution
  - concrete recommended
