

**ARCHITECTURAL STRUCTURES I:
STATICS AND STRENGTH OF MATERIALS**

ENDS 231

DR. ANNE NICHOLS

SUMMER 2006

**lecture
fourteen**

**mechanics of
materials**

Mechanics of Materials

- MECHANICS

- MATERIALS

Mechanics of Materials

- *external loads and their effect on deformable bodies*
- *use it to answer question if structure meets requirements of*
 - *stability and equilibrium*
 - *strength and stiffness*
- *other principle building requirements*
 - *economy, functionality and aesthetics*

Knowledge Required

- *material properties*
- *member cross sections*
- *ability of a material to resist breaking*
- *structural elements that resist excessive*
 - *deflection*
 - *deformation*

Figure 2.34 An example of torsion on a cantilever beam.

Problem Solving

1. STATICS:

*equilibrium of external forces,
internal forces, stresses*

2. GEOMETRY:

*cross section properties, deformations and
conditions of geometric fit, strains*

3. MATERIAL PROPERTIES:

*stress-strain relationship for each material
obtained from testing*

Stress

- *stress is a term for the intensity of a force, like a pressure*
- *internal or applied*
- *force per unit area*

$$\text{stress} = f = \frac{P}{A}$$

Design

- *materials have a critical stress value where they could break or yield*
 - *ultimate stress*
 - *yield stress*
 - *compressive stress*
 - *fatigue strength*
 - *(creep & temperature)*
- acceptance vs. failure*

Design (cont)

- we'd like

$$f_{\text{actual}} \ll F_{\text{allowable}}$$

- stress distribution may very: average
- uniform distribution exists IF the member is loaded axially (concentric)

Scale Effect

- *model scale*
 - *material weights, small areas*
- *structural scale*
 - *much more material weight, bigger areas*
- *ratio is not constant:*

$$\frac{\gamma L^3}{L^2} = \gamma L$$

Strain (next lecture)

- *materials deform*
- *axially loaded materials change length*
- *bending materials deflect*

- **STRAIN:**
 - *change in length over length*

$$\text{strain} = \varepsilon = \frac{\Delta L}{L}$$

Normal Stress

- normal stress is normal to the cross section
 - stressed area is perpendicular to the load

$$f_{t \text{ or } c} = \frac{P}{A}$$

(σ)

Shear Stress

- stress parallel to a surface

$$f_v = \frac{P}{A} = \frac{P}{td}$$

(τ_{ave})

Figure 5.10 Shear stress between two glued blocks.

Bearing Stress

- *stress on a surface by contact in compression*

$$f_p = \frac{P}{A} = \frac{P}{td}$$

(σ)

Bending Stress

- *normal stress caused by bending*

$$f_b = \frac{Mc}{I} = \frac{M}{S}$$

(σ)

Torsional Stress

- *shear stress caused by twisting*

$$f_v = \frac{T\rho}{J}$$

(τ)

Structures and Shear

- *what structural elements see shear?*
 - *beams*
 - *bolts*
 - *splices*
 - *slabs*
 - *footings*
 - *walls*
 - *wind*
 - *seismic loads*

} *connections*

Bolts

- *connected members in tension cause shear stress*

(a) Two steel plates bolted using one bolt.

(b) Elevation showing the bolt in

- *connected members in compression cause bearing stress*

Bearing stress on plate.

Single Shear

- *seen when 2 members are connected*

Double Shear

- *seen when 3 members are connected*
- two areas

$$f_v = \frac{P}{2A}$$

(two shear planes)

$$f_v = \frac{P}{2A} = \frac{P/2}{A} = \frac{P/2}{\pi d^2/4}$$

Free-body diagram of middle section of the bolt in shear.

Figure 5.12 A bolted connection in double shear.

Bolt Bearing Stress

- *compression & contact*
- *projected area*

$$f_p = \frac{P}{A_{\text{projected}}} = \frac{P}{td}$$
