

ARCHITECTURAL STRUCTURES I:
STATICS AND STRENGTH OF MATERIALS
ENDS 231

DR. ANNE NICHOLS

FALL 2007

lecture
one

**statics and strength
of materials**

TOPIC 1

Architectural Structures I
ENDS 231

F2005abn

Syllabus & Student Understandings

Introduction 2

Architectural Structures I
ENDS 231

Su2004abn

Course Description

- **statics**
 - physics of forces and reactions on bodies and systems
 - equilibrium (bodies at rest)
- **structures**
 - something made up of interdependent parts in a definite pattern of organization

Introduction 3

Architectural Structures I
ENDS 231

Su2004abn

Course Description

- **mechanics of materials**
 - external loads and effect on deformable bodies
 - use it to answer question if structure meets requirements of
 - stability and equilibrium
 - strength and stiffness
 - other principle building requirements
 - economy, functionality and aesthetics

Introduction 4

Architectural Structures I
ENDS 231

Su2004abn

Structural System Selection

- kind & size of loads
- building function
- soil & topology of site
- systems integration
- fire rating
- construction (\$\$, schedule)
- architectural form

Introduction 7
Lecture 1

Architectural Structures I
ENDS 231

Su2005abn

Structure Requirements (cont)

- strength & stiffness
 - concerned with stability of components

Figure 1.15 Stability and the strength of a structure—the collapse of a portion of the UW Husky stadium during construction (1987) due to a lack of adequate bracing to ensure stability. Photo by author.

Introduction 6

Architectural Structures I
ENDS 231

Su2004abn

Structure Requirements

- stability & equilibrium
 - STATICS

Figure 1.16 Equilibrium and Stability?—sculpture by Richard Byer. Photo by author.

Introduction 5

Architectural Structures I
ENDS 231

Su2004abn

Knowledge Required

- external forces
- internal forces
- material properties
- member cross sections
- ability of a material to resist breaking
- structural elements that resist excessive
 - deflection
 - deformation

Figure 2.34 An example of torsion on a cantilever beam.

Introduction 7

Architectural Structures I
ENDS 231

Su2004abn

Problem Solving

1. STATICS:

equilibrium of external forces,
internal forces, stresses

2. GEOMETRY:

cross section properties, deformations and
conditions of geometric fit, strains

3. MATERIAL PROPERTIES:

stress-strain relationship for each material
obtained from testing

Relation to Architecture

“The geometry and arrangement of the load-bearing members, the use of materials, and the crafting of joints all represent opportunities for buildings to express themselves. The best buildings are not designed by architects who after resolving the formal and spatial issues, simply ask the structural engineer to make sure it doesn’t fall down.” -Onouye & Kane

Statics and Strength of Materials for
Architecture and Building Construction

Architectural Structures

- incorporates
 - stability and equilibrium
 - strength and stiffness
 - economy, functionality and aesthetics
- uses
 - sculpture
 - furniture
 - buildings

Architectural Space and Form

- evolution traced to developments in structural engineering and material technology
 - stone & masonry
 - timber
 - concrete
 - cast iron, steel
 - tensile fabrics, pneumatic structures.....

Structural Math

- *physics takes observable phenomena and relates the measurement with rules: mathematical relationships*
- *need*
 - *reference frame*
 - *measure of length, mass, time, direction, velocity, acceleration, work, heat, electricity, light*
 - *calculations & geometry*

Introduction 32

Architectural Structures I
ENDS 231

Su2004abn

Structural Math

- *quantify environmental loads*
 - *how big is it?*
- *evaluate geometry and angles*
 - *where is it?*
 - *what is the scale?*
 - *what is the size in a particular direction?*
- *quantify what happens in the structure*
 - *how big are the internal forces?*
 - *how big should the beam be?*

Introduction 31

Architectural Structures I
ENDS 231

Su2004abn

Physics for Structures

- *measures*
 - *US customary & SI*

Units	US	SI
Length	in, ft, mi	mm, cm, m
Volume	gallon	liter
Mass	lb mass	g, kg
Force	lb force	N, kN
Temperature	F	C

Introduction 33

Architectural Structures I
ENDS 231

Su2004abn

Physics for Structures

- scalars – any quantity
- vectors - quantities with direction
 - like displacements
 - summation results in the “straight line path” from start to end
 - normal vector is perpendicular to something

Introduction 34

Architectural Structures I
ENDS 231

Su2004abn

Language

- symbols for operations: +, -, /, x
- symbols for relationships: (), =, <, >
- algorithms
 - cancellation $\frac{2}{5} \times \frac{5}{6} = \frac{2}{6} = \frac{2}{2 \times 3} = \frac{1}{3}$
 - factors $\frac{x}{6} = \frac{1}{3}$
 - signs
 - ratios and proportions $10^3 = 1000$
 - power of a number
 - conversions, ex. $1X = 10 Y$
 - operations on both sides of equality $\frac{10Y}{1X} \text{ or } \frac{1X}{10Y} = 1$

Introduction 35

Architectural Structures I
ENDS 231

Su2004abn

On-line Practice

- Webct / Study Tools

Introduction 36
Lecture 1

Architectural Structures I
ENDS 231

Su2005abn

Geometry

- angles
 - right = 90°
 - acute < 90°
 - obtuse > 90°
 - $\pi = 180^\circ$
- triangles
 - area = $\frac{b \times h}{2}$
 - hypotenuse
 - total of angles = 180°

$$AB^2 + AC^2 = BC^2$$

Loads and Forces 6

Architectural Structures I
ENDS 231

Su2004abn

Geometry

- *lines and relation to angles*

- *parallel lines can't intersect*

- *perpendicular lines cross at 90°*

- *intersection of two lines is a point*

- *opposite angles are equal when two lines cross*

Loads and Forces 7

Architectural Structures I
ENDS 231

Su2004abn

Geometry

- *intersection of a line with parallel lines results in identical angles*

- *two lines intersect in the same way, the angles are identical*

Loads and Forces 8

Architectural Structures I
ENDS 231

Su2004abn

Geometry

- *sides of two angles are parallel and intersect opposite way, the angles are supplementary - the sum is 180°*

- *two angles that sum to 90° are said to be complimentary*

$$\beta + \gamma = 90^\circ$$

Loads and Forces 9

Architectural Structures I
ENDS 231

Su2004abn

Geometry

- *sides of two angles bisect a right angle (90°), the angles are complimentary*

$$\alpha + \gamma = 90^\circ$$

- *right angle bisects a straight line, remaining angles are complimentary*

Loads and Forces 10

Architectural Structures I
ENDS 231

Su2004abn

Geometry

– similar triangles have proportional sides

$$\frac{AB}{AD} = \frac{AC}{AE} = \frac{BC}{DE}$$

$$\frac{AB}{A'B'} = \frac{AC}{A'C'} = \frac{BC}{B'C'}$$

Loads and Forces 11

Architectural Structures I
ENDS 231

Su2004abn

Trigonometry

• for right triangles

$$\sin = \frac{\text{opposite side}}{\text{hypotenuse}} = \sin \alpha = \frac{AB}{CB}$$

$$\cos = \frac{\text{adjacent side}}{\text{hypotenuse}} = \cos \alpha = \frac{AC}{CB}$$

$$\tan = \frac{\text{opposite side}}{\text{adjacent side}} = \tan \alpha = \frac{AB}{AC}$$

SOHCAHTOA

Loads and Forces 12

Architectural Structures I
ENDS 231

Su2004abn

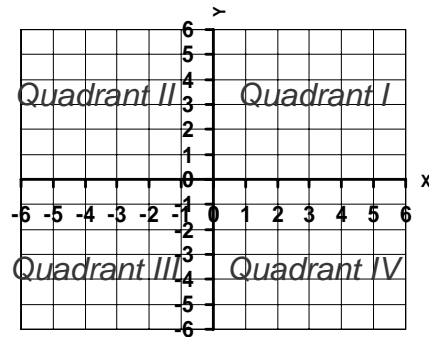

Trigonometry

• cartesian coordinate system

– origin at 0,0

– coordinates in (x,y) pairs

– x & y have signs

Loads and Forces 13

Architectural Structures I
ENDS 231

Su2004abn

Trigonometry

• for angles starting at positive x

– sin is y side

– cos is x side

$\sin < 0$ for 180-360°

$\cos < 0$ for 90-270°

$\tan < 0$ for 90-180°

$\tan < 0$ for 270-360°

Loads and Forces 14

Architectural Structures I
ENDS 231

Su2004abn

Trigonometry

- for all triangles
 - sides A, B & C are opposite angles α , β & γ

- LAW of SINES

$$\frac{\sin \alpha}{A} = \frac{\sin \beta}{B} = \frac{\sin \gamma}{C}$$

- LAW of COSINES

$$A^2 = B^2 + C^2 - 2BC \cos \alpha$$

Algebra

- equations (something = something)
- constants
 - real numbers or shown with a, b, c...
- unknown terms, variables
 - names like R, F, x, y
- linear equations
 - unknown terms have no exponents
- simultaneous equations
 - variable set satisfies all equations

Algebra

- solving one equation

- only works with one variable

- ex:

$$2x - 1 = 0$$

- add to both sides

$$2x - 1 + 1 = 0 + 1$$

$$2x = 1$$

- divide both sides

$$\frac{2x}{2} = \frac{1}{2}$$

- get x by itself on a side

$$x = \frac{1}{2}$$

Algebra

- solving one equations

- only works with one variable

- ex:

$$2x - 1 = 4x + 5$$

- subtract from both sides

$$2x - 1 - 2x = 4x + 5 - 2x$$

- subtract from both sides

$$-1 - 5 = 2x + 5 - 5$$

- divide both sides

$$\frac{-6}{2} = \frac{-3 \cdot 2}{2} = \frac{2x}{2}$$

- get x by itself on a side

$$x = -3$$

Algebra

- *solving two equation*

- *only works with two variables*

- *ex:* $2x + 3y = 8$

- *look for term similarity* $12x - 3y = 6$

- *can we add or subtract to eliminate one term?*

- *add* $2x + 3y + 12x - 3y = 8 + 6$

- $14x = 14$

- *get x by itself on a side* $\frac{14x}{14} = \frac{14}{14} = x = 1$
