

lecture
 twenty three

stability and columns

Stability 1
 Lecture 23

Architectural Structures I
 ENDS 231

F2005abn

Additional Design Criteria

- designed for strength & stresses
- designed for serviceability & deflection
- need to design for stability
 - ability to support a specified load without sudden or unacceptable deformations

Stability 4
 Lecture 23

Architectural Structures I
 ENDS 231

S2004abn

Column Behavior

- objects like lowest energy state

Stability 5
 Lecture 23

Architectural Structures I
 ENDS 231

S2004abn

Stable Equilibrium

- energy added
- things don't change

Stability 6
 Lecture 23

Architectural Structures I
 ENDS 231

S2004abn

Neutral Equilibrium

- energy added
- things change, but not much

Stability 7
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Unstable Equilibrium

- energy added
- things change drastically

Stability 8
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Column Buckling

- axially loaded columns
- long & slender
 - unstable equilibrium = buckling
 - sudden and not good

Fig. 10.1

Fig. 10.2

Stability 9
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Modeling

- can be modeled with a spring at mid-height
- when moment from deflection exceeds the spring capacity ... "boing"
- critical load P

Stability 10
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Effect of Length

- long & slender
- short & stubby

Stability 11
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Buckling Load

- related to deflected shape ($P\Delta$)
- shape of sine wave
- Euler's Formula
- I minimum

$$P_{critical} = \frac{\pi^2 EI_{min}}{(L)^2}$$

Figure 9.3 Leonhard Euler (1707-1783).

Stability 12
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Critical Stress

- short columns

$$f_{critical} = \frac{P_{actual}}{A} < F_a$$

- slenderness ratio = L_e/r (L/d)

- radius of gyration = $r = \sqrt{\frac{I}{A}}$

$$f_{critical} = \frac{P_{critical}}{A} = \frac{\pi^2 EA r^2}{A(L_e)^2} = \frac{\pi^2 E}{\left(\frac{L_e}{r}\right)^2}$$

$$P_{critical} = \frac{\pi^2 EA}{\left(\frac{L_e}{r}\right)^2}$$

Stability 13
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Critical Stresses

- when a column gets stubby, F_y will limit the load
- real world has loads with eccentricity
- C_c for steel and allowable stress

$$\frac{L_e}{r} > C_c = \sqrt{\frac{2\pi^2 E}{F_y}}$$

Fig. 10.9

Stability 14
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Effective Length

- end conditions affect shape
- effective length factor, K $L_e = K \cdot L$

Buckled shape of column shown by dashed line	(a)	(b)	(c)	(d)	(e)	(f)
Theoretical K value	0.5	0.7	1.0	1.0	2.0	2.0
Recommended design values when ideal conditions are approximated	0.65	0.80	1.0	1.2	2.10	2.0

Stability 15
Lecture 23

Architectural Structures I
ENDS 231

S2004abn

Bracing

- bracing affects shape of buckle in one direction
- both should be checked!

Stability 16
Lecture 23

Architectural Structures I
ENDS 231

S2004abn
