ARCHITECTURAL STRUCTURES I:

STATICS AND STRENGTH OF MATERIALS

ENDS 231

DR. ANNE NICHOLS

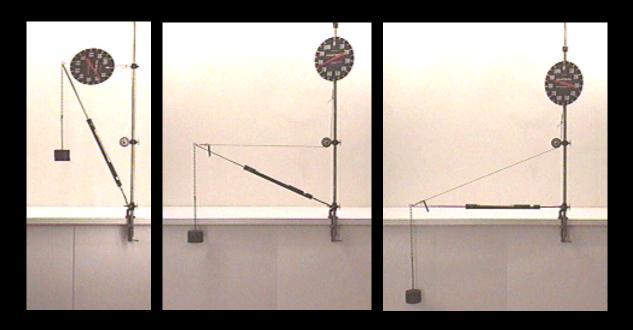

SPRING 2008

three

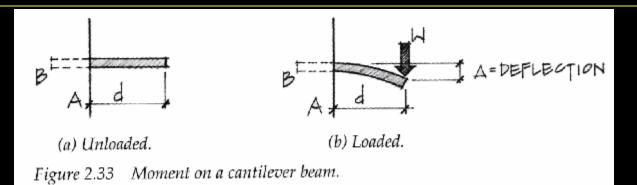

moments

 forces have the tendency to make a body rotate about an axis

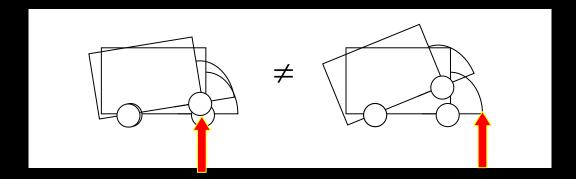

- same translation but different rotation

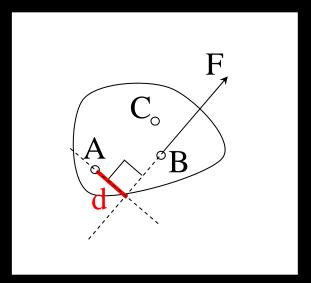

• a force acting at a different point causes a different moment:

- defined by magnitude and direction
- units: N·m, k·ft
- direction:
 - + ccw (right hand rule)
 - CW
- value found from F and ⊥ distance

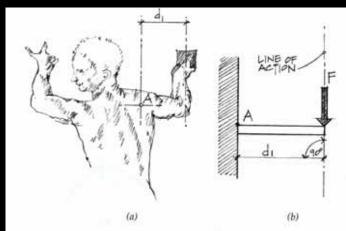

$$M = F \cdot d$$

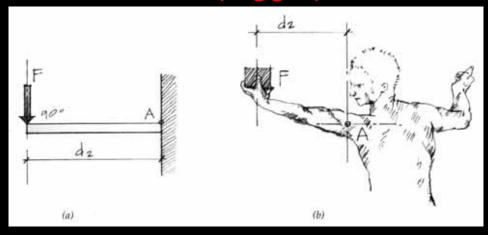

• d also called "lever" or "moment" arm

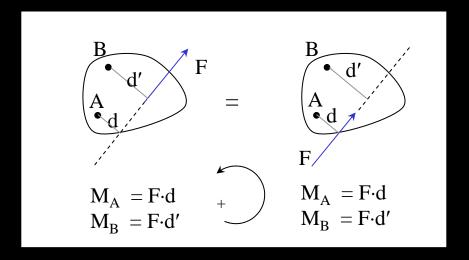

• with same F:

$$M_{\scriptscriptstyle A} = F \cdot d_1 < M_{\scriptscriptstyle A} = F \cdot d_2$$
 (bigger)

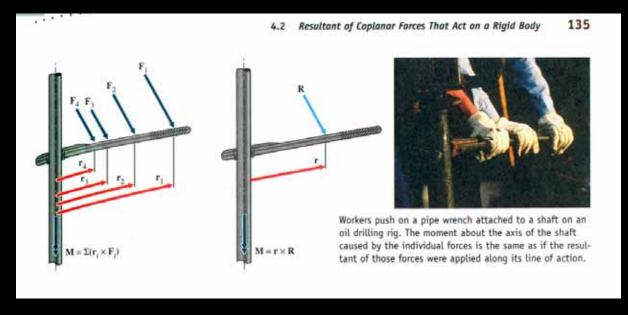

- additive with sign convention
- can still move the force along the line of action

- Varignon's Theorem
 - resolve a force into components at a point and finding perpendicular distances
 - calculate sum of moments
 - equivalent to original moment
- makes life easier!
 - geometry
 - when component runs through point, d=0

Physics & Moments of a Force

- moments of a force
 - introduced in Physics as "Torque Acting on a Particle"
 - and used to satisfy rotational equilibrium

Physics and Moments of a Force

• my Physics book:

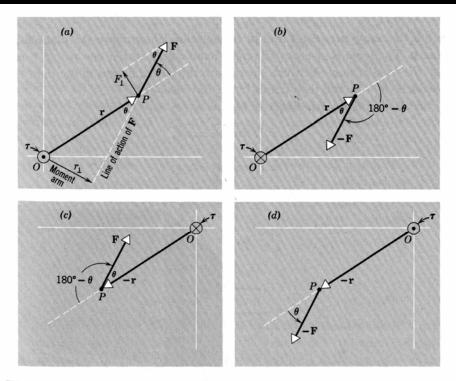

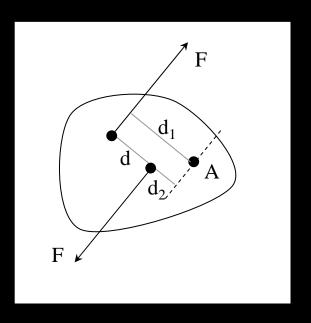

FIGURE 11-2 The plane shown is that defined by \mathbf{r} and \mathbf{F} in Fig. 11-1. (a) The magnitude of $\boldsymbol{\tau}$ is given by Fr_{\perp} (Eq. 11-2b) or by rF_{\perp} (Eq. 11-2c). (b) Reversing \mathbf{F} reverses the direction of $\boldsymbol{\tau}$. (c) Reversing \mathbf{r} reverses the direction of $\boldsymbol{\tau}$. (d) Reversing \mathbf{F} and \mathbf{r} leaves the direction of $\boldsymbol{\tau}$ unchanged. The directions of $\boldsymbol{\tau}$ are represented by \odot (perpendicularly out of the figure, the symbol representing the tip of an arrow) and by \otimes (perpendicularly into the figure, the symbol representing the tail of an arrow).

- 2 forces
 - same size
 - opposite direction
 - distance d apart
 - CW Or CCW

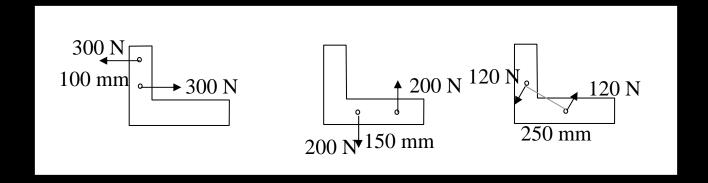

$$M = F \cdot d$$

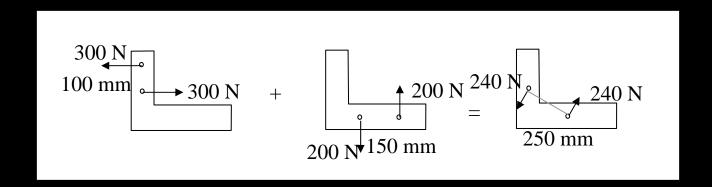

not dependant on point of application

$$M = F \cdot d_1 - F \cdot d_2$$

- equivalent couples
 - same magnitude and direction
 - F & d may be different

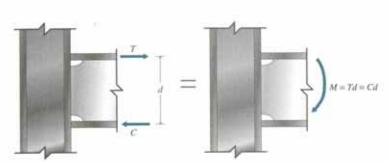

- added just like moments caused by one force
- can <u>replace</u> two couples with a single couple

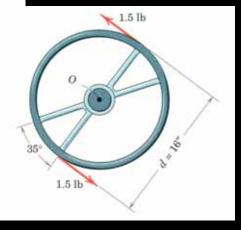

• moment couples in structures

The flanges of a steel beam are welded to the flange of a column. Equal and opposite forces T and C in the beam flanges form a couple with moment M that is transferred into the column.

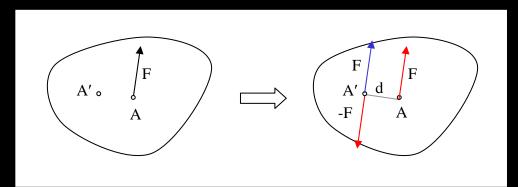

Equivalent Force Systems

- two forces at a point is equivalent to the resultant at a point
- resultant is equivalent to two components at a point
- resultant of equal & opposite forces at a point is zero
- put equal & opposite forces at a point (sum to 0)
- transmission of a force along action line

Force-Moment Systems

 single force causing a moment can be replaced by the same force at a different point by providing the moment that force caused

moments are shown as arched arrows

Force-Moment Systems

 a force-moment pair can be replaced by a force at another point causing the original moment

Parallel Force Systems

- forces are in the same direction
- can find resultant force
- need to find <u>location</u> for equivalent moments
